

Olerup SSP® KIR Genotyping

Product number: 104.101-12 – including *Taq* polymerase

104.101-12u – without *Taq* polymerase

Lot number: 9E6

Expiry date: 2019-11-01

Number of tests: 12

Number of wells per test: 25 + 1

Storage - pre-aliquoted primers: dark at -20°C

- PCR Master Mix: -20°C

- Adhesive PCR seals RT

- Product Insert RT

This Product Description is only valid for Lot No. 9E6.

Complete product documentation consists of generic Instructions for Use (IFU), lot specific Product Insert, Worksheet and Certificate.

CHANGES COMPARED TO THE PREVIOUS OLERUP SSP® KIR GENOTYPING LOT (8D0)

Two wells have been added to KIR Genotyping, wells **25 to 26**.

The KIR Genotyping kit design, specificity and interpretation tables are based on IPD-KIR database 2.6.1.

The primers of the wells detailed below have been exchanged, added or modified compared to the previous lot.

Well	5'-primer	3'-primer	rationale
3	Exchanged	Exchanged	Exchanged primer pair for the 2DL3*012 alleles.
24	Added	Added	Negative control moved to well 26, primer pair added for improved resolution of 2DL4 alleles.
25	New	New	Primer pair added for improved resolution of 2DL5B alleles.
26	-	-	Negative control added from well 24.

Change in revision R01 compared to R00:

1. The Protocol has been corrected, to reflect that two wells have been added to the kit.

Change in revision R02 compared to R01:

1. A footnote has been added to the Specificity and Interpretation Tables, explaining that an "?" reflects that nucleotide sequence information is not available for the primer matching sequence.

Change in revision R03 compared to R02:

1. Typing errors in the Interpretation and Specificity Tables and the Cell Line Validation sheet have been corrected.

Well 26 contains Negative Control primer pairs, that will produce exon 4 and/or exon 5 amplicons for more than 97% of applicable KIR alleles as well as amplicons generated by positive control primer pairs constituent of all primer mixes in the Olerup SSP® product range.

PCR product sizes: 280bp KIR specific amplicons
 430bp Positive control

Length of PCR product	280	280	280	280
5'-primer¹	110 ^{5'-CAg} ^{3'}	109 ^{5'-CCT} ^{3'}	208 ^{5'-CCA} ^{3'}	208 ^{5'-CCg} ^{3'}
3'-primer	187 ^{5'-ggT} ^{3'}	187 ^{5'-ggT} ^{3'}	288 ^{5'-gTC} ^{3'}	288 ^{5'-gTC} ^{3'}
	187 ^{5'-ggT} ^{3'}	187 ^{5'-ggT} ^{3'}	288 ^{5'-ggT} ^{3'}	288 ^{5'-ggT} ^{3'}
			288 ^{5'-gAT} ^{3'}	288 ^{5'-gAT} ^{3'}
2DL1*	+		+	
2DL2*	+		+	
2DL3*	+		+	
2DL4*	N/A	N/A		+
2DL5A*	N/A	N/A	+

3DP1*	+		+	

¹The codon position for KIR genes, in the 4th or 5th exon, matching the specificity-determining 3'-end of the primer is given. Codon numbering as on the www.ebi.ac.uk/ipd/kir web site. The sequence of the 3 terminal nucleotides of the primer is given.

PRODUCT DESCRIPTION

KIR Genotyping SSP typing

CONTENT

The primer set contains 5'- and 3'-primers for KIR Genotyping.

PLATE LAYOUT

Each test consists of 26 PCR reactions in a 32 well cut PCR plate. Wells 27 to 32 are empty.

1	2	3	4	5	6	7	8
9	10	11	12	13	14	15	16
17	18	19	20	21	22	23	24
25	NC	empty	empty	empty	empty	empty	empty

The 32 well cut PCR plate is marked with 'KIR GENOTYP' in silver/gray ink.

Well No. 1 is marked with the Lot No. '9E6'.

Wells 1 to 25 – KIR Genotyping primers.

Well 26 – Negative Control.

A faint row of numbers is seen between wells 1 and 2 or wells 7 and 8 of the PCR trays.

These stem from the manufacture of the trays, and should be disregarded.

The PCR plates are covered with a PCR-compatible foil.

Please note: When removing each 32 well PCR plate, make sure that the remaining plates stay covered. Use a scalpel or a similar instrument to carefully cut the foil between the plates.

UNIQUELY IDENTIFIED ALLELES

All the KIR alleles available in the IPD KIR Sequence Database in February 2015¹ will be amplified by the primers in the KIR Genotyping SSP kit.

¹KIR alleles listed on the IPD KIR web page 2015-February-17, release 2.6.1, www.ebi.ac.uk/ipd/kir.

PROTOCOL

DNA EXTRACTION

Extracted, highly pure DNA is needed for SSP typings. DNA samples to be used for PCR-SSP HLA typing should be re-suspended in dH₂O. The A260/A280 ratio should be 1.6 – 2.0 by UV spectrophotometry for optimal band visualization during electrophoresis.

We recommend automated DNA extraction with the QIAGEN EZ1 DSP DNA Blood System. ACD blood should be used as starting material.

Alternatively, the DNA can be extracted by any preferred method yielding pure DNA. When using alternative methods, the DNA concentration should be adjusted to 30 ng/μl. ***Do not use heparinised blood with these methods.***

Recommended DNA concentration using:

EZ1-extracted DNA, 15 ng/μl.

DNA extracted by other methods, 30 ng/μl.

Concentrations exceeding 50 ng/μl will increase the risk for nonspecific amplifications and weak extra bands. If necessary, dilute the extracted DNA in dH₂O.

DNA samples should not be re-suspended in solutions containing chelating agents such as EDTA, above 0.5 mM in concentration.

DNA samples may be used immediately after extraction or stored at +4°C for up to 2 weeks with no adverse effects on results. DNA samples can be stored at -20°C or colder for 9 months. The purity and concentration of extracted DNA samples that have been stored for a prolonged period should be tested for acceptability prior to HLA typing.

DNA samples should be shipped at +4°C or colder to preserve their integrity during transport.

PCR AMPLIFICATION

104.101-12 – including Taq polymerase

For one KIR Genotyping typing, begin by adding to well No. 26, i.e. the well with the negative control primer pairs:

7 μl dH₂O

3 μl PCR Master Mix complete with Taq,

then add at room temperature in a 0.5 ml tube:

30 x 2 μl = 60 μl DNA (30 ng/μl)

30 x 3 μl = 90 μl PCR Master Mix complete with Taq – mix well before taking your aliquot

30 x 5 μl = 150 μl dH₂O

Mix well, dispense 10 μl of the DNA-PCR Master Mix-H₂O mixture into each of the 25 wells of an KIR Genotyping typing, i.e. wells 1 to 25. Cover the primer tray(s) with the provided

adhesive seals. Check that all reaction wells are completely covered to prevent evaporative loss during PCR amplification.

104.101-12u – without Taq polymerase

For one KIR Genotyping typing, begin by adding at room temperature in a 0.5 ml tube:

30 x 3 µl = 90 µl PCR Master Mix without Taq – mix well before taking your aliquot

2.4 µl Taq polymerase (5 units/µl)

Mix well, dispense 3 µl of the PCR Master Mix-Taq mixture from the 0.5 ml tube into well No. 26, i.e. the well with the negative control primer pairs. Then add 7 µl dH₂O to well 26.

Then add at room temperature to the 0.5 ml tube containing 90 + 2.4 - 3 = 89.4 µl PCR Master Mix-Taq mixture:

30 x 2 µl = 60 µl DNA (30 ng/µl)

30 x 5 µl – 2.4 µl = 147.6 µl dH₂O

Mix well, dispense 10 µl of the DNA-PCR Master Mix-Taq-H₂O mixture into each of the 25 wells of an KIR Genotyping typing, i.e. wells 1 to 25. Cover the primer tray(s) with the provided adhesive seals. Check that all reaction wells are completely covered to prevent evaporative loss during PCR amplification.

Use a 96 well thermal cycler with a heated lid. The temperature gradient across the heating block should be < 1°C.

PCR cycling parameters:

1. 1 cycle	94°C	2 min	denaturation
2. 10 cycles	94°C 65°C	10 sec. 60 sec.	denaturation annealing and extension
3. 20 cycles	94°C 61°C 72°C	10 sec. 50 sec. 30 sec.	denaturation annealing extension
4. End - hold	RT 4°C		if less than 8 hours if longer than 8 hours

Total reaction volume in each well, 10 µl.

The same PCR cycling parameters are used for all the Olerup SSP kits.

AGAROSE GEL ELECTROPHORESIS

Prepare a 2% (w/v) agarose gel in 0.5 x TBE buffer. Dissolve the agarose by boiling in a microwave oven. Let the gel solution cool to 60°C. Stain the gel prior to casting with ethidium bromide (10 mg/ml), 5 µl per 100 ml gel solution. For maximal ease of handling use our ethidium bromide dropper bottles (Product No. 103.301-10), 1 drop of ethidium bromide solution per 50-75 ml of gel. **Note:** Ethidium bromide is a carcinogen. Handle with appropriate personal protective equipment.

104.101-12 – including Taq polymerase

104.101-12u – without Taq polymerase

Lot No.: 9E6

Lot-specific information

www.olerup.com

Load the PCR products, preferably using an 8-channel pipette. Load a DNA size marker (100 base pair ladder, Product No. 103.201-100) in one well per row.

Run the gel in 0.5 x TBE buffer, without re-circulation of the buffer, for 15-20 minutes at 8-10 V/cm.

DOCUMENTATION AND INTERPRETATION

Put the gel on a UV transilluminator and document by photography.

Record the presence and absence of specific PCR products. The relative lengths of the specific PCR products are helpful in the interpretation of the results.

Record the presence and relative lengths of the internal positive control bands. The differently sized control bands will help in the correct orientation of the typing as well as in kit identification.

Lanes without either control band or specific PCR products should be repeated.

Interpret the typings with the ***Lot-specific Interpretation and Specificity Tables***.

PCR MASTER MIXES

The PCR Master Mix complete with *Taq* polymerase contains:

<i>Taq</i> polymerase	0.4 unit per 10 µl SSP reaction
nucleotides	final concentration of each dNTP is 200 µM
PCR buffer	final concentrations: 50 mM KCl, 1.5 mM MgCl ₂ , 10 mM Tris-HCl pH 8.3, 0.001% w/v gelatin
glycerol	final concentration of glycerol is 5%
cresol red	final concentration of cresol red is 100 µg/ml

The same PCR Master Mix complete with *Taq* is used for all Olerup SSP kits.

The PCR Master Mix without *Taq* polymerase contains:

nucleotides	final concentration of each dNTP is 200 µM
PCR buffer	final concentrations: 50 mM KCl, 1.5 mM MgCl ₂ , 10 mM Tris-HCl pH 8.3, 0.001% w/v gelatin
glycerol	final concentration of glycerol is 5%
cresol red	final concentration of cresol red is 100 µg/ml

The same PCR Master Mix without *Taq* is used for all Olerup SSP kits.

SPECIFICITY TABLE**KIR Genotyping SSP typing**

Specificities and sizes of the PCR products of the 25+1 primer mixes used for KIR SSP Genotyping SSP.

Primer Mix	Size of spec. PCR product ¹	Size of control band ²	KIR Gene	Amplified KIR ³ alleles

26^{6,11}	-	-	-	Negative control

¹Alleles are assigned by the presence of specific PCR product(s). However, the sizes of the specific PCR products may be helpful in the interpretation of KIR SSP typings.

When the primers in a primer mix can give rise to KIR-specific PCR products of more than one length this is indicated if the size difference is more than 20 base pairs. Size differences of 20 base pairs or less are not given. For high resolution SSP kits, the alleles listed are specified according to amplicon length.

Nonspecific amplifications, i.e. a ladder or a smear of bands, may sometimes be seen. GC-rich primers have a higher tendency of giving rise to nonspecific amplifications than other primers.

PCR fragments longer than the control bands may sometimes be observed. Such bands should be disregarded and do not influence the interpretation of the SSP typings.

PCR fragments migrating faster than the control bands, but slower than a 400 bp fragment may be seen in some gel read-outs. Such bands can be disregarded and do not influence the interpretation of the SSP typings.

Some primers may give rise to primer oligomer artifacts. Sometimes this phenomenon is an inherit feature of the primer pair(s) of a primer mix. More often it is due to other factors such as too low amount of DNA in the PCR reactions, taking too long time in setting up the PCR reactions, working at elevated room temperature or using thermal cyclers that are not pre-heated.

²The internal positive control primer pairs amplify segments of the human growth hormone gene. The internal positive control bands are 1070, 800, 515 or 430 base pairs respectively, well distribution as outlined in the table. The well distribution of the internal controls can help in orientation of the kit on gel photo, as well as allow for kit identification. In the presence of a specific amplification the intensity of the control band often decreases.

³KIR alleles listed on the IPD KIR web page 2015-February-17, release 2.6.1, www.ebi.ac.uk/ipd/kir.

⁴Specific PCR products shorter than 125 base pairs have a lower intensity and are less sharp than longer PCR products.

⁵The specific PCR product generated by primer mixes 6 and 7 are longer than the internal positive control band and the positive control band may be weaker than for other KIR primer mixes.

⁶Primer mixes 5, 7 and 26 have a tendency to giving rise to primer oligomer formation.

⁷Primer mixes 2, 3, 7 and 13 may have tendencies of unspecific amplifications.

⁸Primer mix 7 may give rise to a lower yield of specific PCR product than the other KIR primer mixes.

⁹The 2DL2*004 and the 2DL2*0010101-013 alleles may be distinguished by the different sizes of the specific PCR product in primer mix 2; three specific PCR fragments of 65, 150 and 225 bp in the 2DL2*004 and 2DL2*011 alleles and one specific PCR fragment of 150 bp in the 2DL2*0010101-00304, 005-010 and 012-013 alleles.

¹⁰The 2DS1 and the 3DP1 amplicons in primer mix 22 are differentiated by amplicon size; a specific PCR fragment of 95 bp for the 2DS1*0020101-008 alleles and a specific PCR fragment of 235 bp for the 3DP1*001-002, 004, 007, 0090101-00902 and 011-012 alleles.

¹¹Well 26 contains negative control primer pairs, that will produce exon 4 and/or exon 5 amplicons for more than 97% of applicable KIR alleles as well as amplicons generated by positive control primer pairs.

'?', nucleotide sequence information not available for the primer matching sequence.

¹The provided cell line KIR specificities are retrieved from the www.ebi.ac.uk/ipd/kir web site. The specificity of an individual cell line may thus be subject to change.

²The specificity of each primer solution in the kit has been tested against 48 well characterized cell line DNAs and where applicable, additional cell line DNAs.

Additional primers in primer solution 3 were tested by separately adding another 5'-primer respective another 3'-primer.

In primer solution 21 it was only possible to test the 5'-primer, the 3'-primer was not possible to test.

In primer solutions 1 and 7 one of the 5'-primers was not possible to test, in primer mix 24 one 3'-primer was not possible to test, and in primer solution 2, 3 and 16 one 5'-primer and one 3'-primer were not possible to test.

TRADEMARKS USED IN THIS DOCUMENT/PRODUCT

Olerup SSP® is a registered trademark of Olerup SSP AB.
Qiagen™ is a trademark of QIAGEN.

WARRANTY

Olerup SSP AB warrants its products to the original purchaser against defects in materials and workmanship under normal use and application. Olerup SSP AB's sole obligation under this warranty shall be to replace, at no charge, any product that does not meet the performance standards stated on the product specification sheet.

This warranty applies only to products that have been handled and stored in accordance with Olerup SSP AB's recommendations, and does not apply to products that have been the subject of alteration, misuse, or abuse.

All claims under this warranty must be directed to Olerup SSP AB in writing and must be accompanied by a copy of the purchaser's invoice. This warranty is in lieu of all other warranties, expressed or implied, including the warranties of merchantability and fitness for a particular purpose. In no case shall Olerup SSP AB be liable for incidental or consequential damages.

This product may not be reformulated, repacked or resold in any form without the written consent of Olerup SSP AB, Franzengatan 5, SE-112 51 Stockholm, Sweden.

Handle all samples as if capable of transmitting disease. All work should be performed wearing gloves and appropriate protection.

GUARANTEE

Olerup SSP AB guarantees that the primers in the Olerup SSP® typing trays have the specificities given in the lot-specific Specificity and Interpretation Tables of the product insert.

When stored at -20°C, the dried primers are stable for 30 months from the date of manufacture.

When stored at -20°C, the PCR Master Mix including Taq polymerase and the PCR Master Mix without Taq polymerase are stable for 33 months from the date of manufacture.
