Olerup SSP® KIR Genotyping

Product number: 104.101-12 – including *Taq* polymerase

104.101-12u – without *Tag* polymerase

Lot number: 3K9

Expiry date: 2023-10-01

Number of tests: 12 Number of wells per test: 26+1

Storage - pre-aliquoted primers: dark at -20°C

PCR Master Mix: -20°C
 Adhesive PCR seals
 Product Insert
 RT

This Product Description is only valid for Lot No. 3K9.

Complete product documentation consists of generic Instructions for Use (IFU), lot specific Product Insert, Worksheet and Certificate.

CHANGES COMPARED TO THE PREVIOUS *OLERUP* SSP® KIR GENOTYPING LOT (3H3)

The KIR Genotyping kit design, specificity and interpretation tables are based on IPD-KIR database 2.8.0.

The primers of the wells detailed below have been exchanged, added or modified compared to the previous lot.

| Well | 5'-primer | 3'-primer | rationale |
|------|-----------|-----------|---|
| 3 | Modified | Modified | 5'-primer and 3'-primer modified for improved |
| | | | KIR-specific amplification. |

Changes in revision R01 compared to R00:

1. Primer mix 26 amplifies the following alleles: 2DS5*001?, 2DS5*0020101-0020104, 2DS5*003?-00502?, 2DS5*00801?-009?, 2DS5*011?-017?. The corrections above have been implemented to the specificity and interpretation tables.

Changes in revision R02 compared to R01:

- 1. The sizes of the specific PCR products in wells 3, 5, 8 and 10 have been corrected. Changes in revision R03 compared to R02:
- 1. The footnote referring to a lower yield of specific PCR product in primer mix 7 was modified. Changes in R04 compared to R03:
- 1. Primer mix 14 amplifies the 3DS1*078 allele. The correction has been implemented in the specificity and interpretation tables.

PRODUCT DESCRIPTION

KIR Genotyping SSP typing

CONTENT

The primer set contains 5'- and 3'-primers for KIR Genotyping.

PLATE LAYOUT

Each test consists of 27 PCR reactions in a 32 well cut PCR plate. Wells 28 to 32 are empty.

| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----|----|----|-------|-------|-------|-------|-------|
| 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 |
| 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 |
| 25 | 26 | NC | empty | empty | empty | empty | empty |

The 32 well cut PCR plate is marked with 'KIR GENOTYP' in silver/gray ink.

Well No. 1 is marked with the Lot No. '3K9'.

Wells 1 to 26 – KIR Genotyping primers.

Well 27 – Negative Control.

A faint row of numbers is seen between wells 1 and 2 or wells 7 and 8 of the PCR trays. These stem from the manufacture of the trays, and should be disregarded. The PCR plates are covered with a PCR-compatible foil.

Please note: When removing each 32 well PCR plate, make sure that the remaining plates stay covered. Use a scalpel or a similar instrument to carefully cut the foil between the plates.

UNIQUELY IDENTIFIED ALLELES

All the KIR alleles available in the IPD KIR Sequence Database in November 2018¹ will be amplified by the primers in the KIR Genotyping SSP kit.

¹KIR alleles listed on the IPD KIR web page 2018-November-30, release 2.8.0, www.ebi.ac.uk/ipd/kir.

PROTOCOL

DNA EXTRACTION

Extracted, highly pure DNA is needed for SSP typings. DNA samples to be used for PCR-SSP HLA typing should be re-suspended in dH $_2$ O. The A260/A280 ratio should be 1.6 – 2.0 by UV spectrophotometry for optimal band visualization during electrophoresis.

We recommend automated DNA extraction with the QIAGEN EZ1 DSP DNA Blood System. ACD blood should be used as starting material.

Alternatively, the DNA can be extracted by any preferred method yielding pure DNA. When using alternative methods, the DNA concentration should be adjusted to 30 $ng/\mu l$. **Do not use heparinised blood with these methods.**

Recommended DNA concentration using:

EZ1-extracted DNA, 15 ng/μl.

DNA extracted by other methods, 30 ng/µl.

Concentrations exceeding 50 $ng/\mu l$ will increase the risk for nonspecific amplifications and weak extra bands. If necessary, dilute the extracted DNA in dH_2O .

DNA samples should not be re-suspended in solutions containing chelating agents such as EDTA, above 0.5 mM in concentration.

DNA samples may be used immediately after extraction or stored at +4°C for up to 2 weeks with no adverse effects on results. DNA samples can be stored at -20°C or colder for 9 months. The purity and concentration of extracted DNA samples that have been stored for a prolonged period should be tested for acceptability prior to HLA typing.

DNA samples should be shipped at +4°C or colder to preserve their integrity during transport.

PCR AMPLIFICATION

INSTRUMENT REQUIREMENTS

A thermocycler with the following minimum specifications should be used:

- heated lid with a temperature of 104°C for oil-free operation
- sample block (aluminum, silver, or gold-plated silver) for use with either a 96-well PCR plate or 0.2 ml thin-walled reaction tubes
- Olerup SSP kits are validated on the following cyclers.

Recommended ramp rates:

- GeneAmp 9700: GeneAmp 9700 cycler set to the 9600 mode. This correspond to a **sample ramp rate** of 1.6°C/s up and 0.8°C/s down.

Product Insert

KIR Genotyping 104.101-12 - including *Taq* polymerase

Page 5 of 16 Visit www.caredx.com for "Instructions for Use" (IFU)

104.101-12u - without *Taq* polymerase Lot No.: 3K9 Lot-specific information

ProFlex 1x96-well block: ProFlex PCR cycler with a block ramp rate of 3.0°C/s (each step 3.0°C/s). A **block ramp rate** of 3.0°C/s correspond to a sample ramp rate of 1.52°C/s up and 1.36°C/s down.

ProFlex 2x96-well block: ProFlex PCR cycler with a block ramp rate of 3.0°C/s (each step 3.0°C/s). A **block ramp rate** of 3.0°C/s correspond to a sample ramp rate of 1.9°C/s up and 1.6°C/s down.

Note: Higher ramp rates than the equivalent to the described may have an effect on the typing results. Please also note that the effect on the typing may differ between different non-validated cyclers depending on the settings.

- temperature range of 4.0°C to 99.9°C
- temperature accuracy of ±0.25°C over the range of 35°C to 99.9°C
- sample block temperature uniformity of ≤0.75°C over the range of 55°C to 95°C
- temperature calibration traceable to a reference standard (i.e., NIST)

Program the thermocycler using the PCR Cycling Parameters specified below.

For specific thermocycler information refer to the manufacturer's user manual. Thermocyclers should be calibrated according to ASHI (American Society of Histocompatibility and Immunogenetics) or EFI (European Federation of Immunogenetics) accreditation rules.

Program the thermocycler before starting the Directions for Use described below.

104.101-12 – including Taq polymerase

For one KIR Genotyping typing, begin by adding to well No. 27, i.e. the well with the negative control primer pairs:

7 ul dH2O

3 µl PCR Master Mix complete with Tag,

then add at room temperature in a 0.5 ml tube:

 $31 \times 2 \mu I = 62 \mu I DNA (30 ng/\mu I)$

31 x 3 μ l = 93 μ l PCR Master Mix complete with Tag – mix well before taking your aliquot

Mix well, dispense 10 μl of the DNA-PCR Master Mix-H₂O mixture into each of the 26 wells of an KIR Genotyping typing, i.e. wells 1 to 26. Cover the primer tray(s) with the provided adhesive seals. Check that all reaction wells are completely covered to prevent evaporative loss during PCR amplification.

104.101-12u – without *Taq* polymerase

For one KIR Genotyping typing, begin by adding at room temperature in a 0.5 ml tube:

> 31 x 3 μ l = 93 μ l PCR Master Mix without Tag – mix well before taking your aliquot

Page 6 of 16
Visit <u>www.caredx.com</u> for
"Instructions for Use" (IFU)

Lot No.: **3K9** Lot-specific information

2.5 μl *Taq* polymerase (5 units/μl)

Mix well, dispense 3 μ l of the PCR Master Mix-Taq mixture from the 0.5 ml tube into well No. 27, i.e. the well with the negative control primer pairs. Then add 7 μ l dH₂O to well 27.

Then add at room temperature to the 0.5 ml tube containing 93 + 2.5 - 3 = 92.5 μ l PCR Master Mix-Tag mixture:

$$31 \times 2 \mu I = 62 \mu I DNA (30 ng/\mu I)$$

$$31 \times 5 \mu l - 2.5 \mu l = 152.6 + 5 \mu l dH_2O$$

Mix well, dispense 10 μ l of the DNA-PCR Master Mix-Taq-H₂O mixture into each of the 26 wells of an KIR Genotyping typing, i.e. wells 1 to 26. Cover the primer tray(s) with the provided adhesive seals. Check that all reaction wells are completely covered to prevent evaporative loss during PCR amplification.

Use a 96 well thermal cycler with a heated lid. The temperature gradient across the heating block should be < 1°C.

PCR cycling parameters:

| 1. 1 cycle | 94°C | 2 min | denaturation |
|---------------|----------------------|-------------------------------|---|
| 2. 10 cycles | 94°C 65°C | 10 sec. 60 sec. | denaturation annealing and extension |
| 3. 20 cycles | 94°C 61°C 72°C | 10 sec. 50 sec. 30 sec. | denaturation annealing extension |
| 4. End - hold | RT 4°C | | if less than 8 hours if longer than 8 hours |

Total reaction volume in each well, 10 µl.

The same PCR cycling parameters are used for all the Olerup SSP kits.

AGAROSE GEL ELECTROPHORESIS

Prepare a 2% (w/v) agarose gel in 0.5 x TBE buffer. Dissolve the agarose by boiling in a microwave oven. Let the gel solution cool to 60° C. Stain the gel prior to casting with ethidium bromide (10 mg/ml), 5 μ l per 100 ml gel solution. For maximal ease of handling use our ethidium bromide dropper bottles (Product No. 103.301-10), 1 drop of ethidium bromide solution per 50-75 ml of gel. Note: Ethidium bromide is a carcinogen. Handle with appropriate personal protective equipment. Load the PCR products, preferably using an 8-channel pipette. Load a DNA size

Load the PCR products, preferably using an 8-channel pipette. Load a DNA size marker (100 base pair ladder, Product No. 103.201-100) in one well per row.

Run the gel in 0.5 x TBE buffer, without re-circulation of the buffer, for 15-20 minutes at 8-10 V/cm.

DOCUMENTATION AND INTERPRETATION

Put the gel on a UV transilluminator and document by photography.

Record the presence and absence of specific PCR products. The relative lengths of the specific PCR products are helpful in the interpretation of the results.

Record the presence and relative lengths of the internal positive control bands. The differently sized control bands will help in the correct orientation of the typing as well as in kit identification.

Lanes without either control band or specific PCR products should be repeated.

Interpret the typings with the *lot-specific Interpretation and Specificity Tables*.

PCR MASTER MIXES

September 2022

Rev. No.: 04

The PCR Master Mix complete with *Taq* polymerase contains:

Tag polymerase 0.4 unit per 10 μl SSP reaction

 $\begin{array}{ll} \text{nucleotides} & \text{final concentration of each dNTP is 200 } \mu\text{M} \\ \text{PCR buffer} & \text{final concentrations: 50 mM KCI, 1.5 mM MgCl}_2, \\ \end{array}$

10 mM Tris-HCl pH 8.3, 0.001% w/v gelatin

glycerol final concentration of glycerol is 5%

cresol red final concentration of cresol red is 100 µg/ml

The same PCR Master Mix complete with Taq is used for all Olerup SSP kits.

The PCR Master Mix without *Taq* polymerase contains:

 $\begin{array}{ll} \text{nucleotides} & \text{final concentration of each dNTP is 200 } \mu\text{M} \\ \text{PCR buffer} & \text{final concentrations: 50 mM KCl, 1.5 mM MgCl}_2, \\ \end{array}$

10 mM Tris-HCl pH 8.3, 0.001% w/v gelatin

glycerol final concentration of glycerol is 5%

cresol red final concentration of cresol red is 100 µg/ml

The same PCR Master Mix without Tag is used for all Olerup SSP kits.

¹Alleles are assigned by the presence of specific PCR product(s). However, the sizes of the specific PCR products may be helpful in the interpretation of KIR SSP typings.

When the primers in a primer mix can give rise to KIR-specific PCR products of more than one length this is indicated if the size difference is more than 20 base pairs. Size differences of 20 base pairs or less are not given. For high resolution SSP kits, the alleles listed are specified according to amplicon length.

Nonspecific amplifications, i.e. a ladder or a smear of bands, may sometimes be seen. GC-rich primers have a higher tendency of giving rise to nonspecific amplifications than other primers.

PCR fragments longer than the control bands may sometimes be observed. Such bands should be disregarded and do not influence the interpretation of the SSP typings.

PCR fragments migrating faster than the control bands, but slower than a 400 bp fragment may be seen in some gel read-outs. Such bands can be disregarded and do not influence the interpretation of the SSP typings.

Some primers may give rise to primer oligomer artifacts. Sometimes this phenomenon is an inherit feature of the primer pair(s) of a primer mix. More often it is due to other factors such as too low amount of DNA in the PCR reactions, taking too long time in setting up the PCR reactions, working at elevated room temperature or using thermal cyclers that are not pre-heated.

²The internal positive control primer pairs amplify segments of the human growth hormone gene.

Page 10 of 16
Visit <u>www.caredx.com</u> for
"Instructions for Use" (IFU)

Lot No.: **3K9** Lot-specific information

The internal positive control bands are 1070, 800, 515 or 430 base pairs respectively, well distribution as outlined in the table. The well distribution of the internal controls can help in orientation of the kit on gel photo, as well as allow for kit identification. In the presence of a specific amplification the intensity of the control band often decreases.

³KIR alleles listed on the IPD KIR web page 2018-November-30, release 2.8.0, www.ebi.ac.uk/ipd/kir.

⁴Specific PCR products shorter than 125 base pairs have a lower intensity and are less sharp than longer PCR products.

⁵The specific PCR product generated by primer mixes 6 and 7 are longer than the internal positive control band and the positive control band may be weaker than for other KIR primer mixes.

⁶Primer mixes 5, 7 and 27 have a tendency to giving rise to primer oligomer formation.

⁷Primer mixes 2, 3, 7, 13 and 24 may have tendencies of unspecific amplifications.

⁸Primer mix 7 may give rise to a pronounced lower yield of specific PCR product than the other KIR primer mixes.

⁹The 2DL2*004 and 2DL2*011 and the 2DL2*0010101-010 and 012-013 alleles may be distinguished by the different sizes of the specific PCR product in primer mix 2; three specific PCR fragments of 65, 150 and 225 bp in the 2DL2*004 and 2DL2*011 alleles and one specific PCR fragment of 150 bp in the 2DL2*0010101-00304, 005-010 and 012-013 alleles.

¹⁰The 2DS1 and the 3DP1 amplicons in primer mix 22 may be distinguished by the different sizes of the specific PCR product; a specific PCR fragment of 95 bp for the 2DS1*0020101-009 alleles and a specific PCR fragment of 235 bp for the 3DP1*001-002, 004, 007, 0090101-00902 and 011-012 alleles.

¹¹Well 27 contains negative control primer pairs, that will produce exon 4 and/or exon 5 amplicons for more than 97% of applicable KIR alleles as well as amplicons generated by positive control primer pairs.

¹The internal positive control primer pairs amplify segments of the human growth hormone gene. The internal positive control bands are 1070, 800, 515 or 430 base pairs respectively, well distribution as outlined in the table. The well distribution of the internal controls can help in orientation of the kit on gel photo, as well as allow for kit identification. In the presence of a specific amplification the intensity of the control band often decreases.

²The codon position matching the specificity-determining 3'-end of the primer is given. Codon numbering as on the KIR web page 2018-November-30, release 2.8.0, www.ebi.ac.uk/ipd/kir. The sequence of the 3 terminal nucleotides of the primer is given.

³The codon position matching the specificity-determining 3'-end of the primer. Codon numbering as on the KIR web page 2018-November-30, release 2.8.0, www.ebi.ac.uk/ipd/kir. The sequence of the 3 terminal nucleotides of the primer is given in the anti-sense direction.

⁴Primer located upstream of the 1st exon, 84 nucleotides upstream of codon -21.

⁵Primer located upstream of the 1st exon, 104 nucleotides upstream of codon -21.

Product Insert

104.101-12u – without Taq polymerase "Instructions for Use" (IFU)

Lot No.: **3K9** Lot-specific information

¹The provided cell line KIR specificities are retrieved from the www.ebi.ac.uk/ipd/kir web site. The specificity of an individual cell line may thus be subject to change.

²The specificity of each primer solution in the kit has been tested against 48 well characterized cell line DNAs and where applicable, additional cell line DNAs.

No DNAs carrying the alleles to be amplified by primer solution 21 were available.

One additional primer in primer solution 3 was tested by separately adding another 5'-primer. In primer solution 21 it was only possible to test the 5'-primer, the 3'-primer was not possible to test.

In primer solutions 1, 2, 3, 7 and 16 one of the 5'-primers were not possible to test, and in primer mix 2, 16 and 24 one 3'-primer was not possible to test.

TRADEMARKS USED IN THIS DOCUMENT/PRODUCT

Olerup SSP[®] is a registered trademark of *CareDx* AB. QiagenTM is a trademark of QIAGEN.

WARRANTY

CareDx AB warrants its products to the original purchaser against defects in materials and workmanship under normal use and application. CareDx AB's sole obligation under this warranty shall be to replace, at no charge, any product that does not meet the performance standards stated on the product specification sheet.

This warranty applies only to products that have been handled and stored in accordance with *CareDx* AB's recommendations, and does not apply to products that have been the subject of alternation, misuse, or abuse.

All claims under this warranty must be directed to *CareDx* AB in writing and must be accompanied by a copy of the purchaser's invoice. This warranty is in lieu of all other warranties, expressed or implied, including the warranties of merchantability and fitness for a particular purpose. In no case shall *CareDx* AB be liable for incidental or consequential damages.

This product may not be reformulated, repacked or resold in any form without the written consent of *CareDx* AB, Franzengatan 5, SE-112 51 Stockholm, Sweden. Handle all samples as if capable of transmitting disease. All work should be performed wearing gloves and appropriate protection.

GUARANTEE

September 2022

Rev. No.: 04

CareDx AB guarantees that the primers in the Olerup SSP® typing trays have the specificities given in the lot-specific Specificity and Interpretation Tables of the product insert.

When stored at -20°C, the dried primers are stable for 48 months from the date of manufacture.

When stored at -20° C, the PCR Master Mix including Taq polymerase and the PCR Master Mix without Taq polymerase are stable for 51 months from the date of manufacture.
