Olerup SSP® KIR HLA Ligand

Product number: **104.201-12 – including** *Taq* **polymerase**

104.201-12u – without *Tag* polymerase

Lot number: 4E6

Expiry date: 2019-04-01

Number of tests: 12 Number of wells per test: 6+1

Storage - pre-aliquoted primers: dark at -20°C

> - PCR Master Mix: -20°C - Adhesive PCR seals RT - Product Insert RT

This Product Description is only valid for Lot No. 4E6.

Complete product documentation consists of generic Instructions for Use (IFU), lot specific Product Insert, Worksheet and Certificate.

CHANGES COMPARED TO THE PREVIOUS OLERUP SSP® KIR HLA LIGAND LOT (39Y)

A well containing Negative Control primer pairs has been added.

The format of the Product Insert and Worksheet have been changed.

The KIR HLA Ligand specificity and interpretation tables have been updated for the HLA-A, HLA-B and HLA-C alleles described since the previous Olerup SSP® KIR HLA Ligand lot was made (Lot No. 39Y). The kit design is based on IMGT/HLA database 3.25.0.

As of lot series V, the Specificity Table is included in the lot-specific Product Insert, and the Interpretation Table is included in the Worksheet.

The primers of the wells detailed below have been exchanged, added or modified compared to the previous lot.

Well	5'-primer	3'-primer	rationale
1	-	Exchanged	3'-primer exchanged for improved allelic resolution.
3	-	Added	3'-primers added for the B*13:12:02, B*44:02:19 and B*44:11 alleles.
4	-	Added	3'-primer added for the B*51:01:40 allele.
6	-	Added	3'-primer added for the B*37:01:02 allele.

Well **7** contains <u>Negative Control primer pairs</u>, that will amplify more than 95% of the *Olerup* SSP® HLA Class I, DRB, DQB1, DPB1 and DQA1 amplicons as well as all the amplicons generated by the control primer pairs matching the human growth hormone gene.

HLA-specific PCR product sizes range from 75 to 200 base pairs. The PCR product generated by the positive control primer pair is 430 base pairs.

¹The nucleotide position for HLA class I genes and the codon for HLA class II genes, in the 2nd or 3rd exon, matching the specificity-determining 3'-end of the primer is given. Nucleotide and codonnumbering as on the www.ebi.ac.uk/imgt/hla web site. The sequence of the 3 terminal nucleotides of the primer is given.

²The nucleotide position for HLA class I genes and the codon for HLA class II genes, in the 2nd or 3rd exon or the 2nd intron, matching the specificity-determining 3'-end of the primer is given in the anti-sense direction. Nucleotide and codon numbering as on the www.ebi.ac.uk/imgt/hla web site. The sequence of the 3 terminal nucleotides of the primer is given.

PRODUCT DESCRIPTION

KIR HLA Ligand SSP typing

CONTENT

The primer set contains 5'- and 3'-primers for determining KIR HLA Ligand nucleotide sequence motifs;

HLA-C alleles encoding Asparagine or Lysine at position 80,

HLA-B^{Bw4+} alleles encoding Isoleucine or Threonine at position 80,

HLA-B^{Bw4+} alleles encoding Aspartic acid at position 77 and Threonine at position 80 and HLA-A^{Bw4+} alleles.

PLATE LAYOUT

Each test consists of 7 PCR reactions in an 8 well cut PCR plate. Well 8 is empty.

1 2 3 4 5 6 NC empty

The 8 well cut PCR plate is marked with 'LIG' in silver/gray ink.

Well No. 1 is marked with the Lot Number '4E6'.

Wells 1 and 2: HLA-C KIR ligand primers.

Wells 3, 4 and 6: HLA-B KIR ligand primers.

Well 5: HLA-A KIR ligand primers.

Well 7 – Negative Control (NC).

A faint row of numbers is seen between wells 1 and 2 or wells 7 and 8 of the PCR trays. These stem from the manufacture of the trays, and should be disregarded. The PCR plates are covered with a PCR-compatible foil.

Please note: When removing each 8 well PCR plate, make sure that the remaining plates stay covered. Use a scalpel or a similar instrument to carefully cut the foil between the plates.

UNIQUELY IDENTIFIED ALLELES

October 2016

Rev. No.: 00

The HLA-A, HLA-B and HLA-C alleles recognized by the HLA Nomenclature Committee in July 2016^{1,2,3} have been considered in the Specificity and Interpretation Tables.

¹The primer pairs in primer mix 1 will not amplify the C*01:46^{Asn80}, C*07:78:02 ^{Asn80}, C*07:426 ^{Asn80}, C*07:459 ^{Asn80}, C*07:478 ^{Asn80} and C*16:94 ^{Asn80} alleles.

The primer pairs in primer mix 2 will also amplify the C*05:32^{Arg80}, C*06:160 ^{Gln80}, C*15:60^{Gln80} and C*15:71 lle80 alleles.

The primer pairs in primer mix 3 will not amplify the B*44:05:03 Thr80, B*44:152 Thr80, B*44:196 Thr80 alleles.

The primer pairs in primer mix 6 will not amplify the $B^*27:49^{Thr80}$, $B^*27:142^{Thr80}$, $B^*37:10^{Thr80}$ and $B^*47:04^{Thr80}$ alleles.

²HLA-A, HLA-B and HLA-C alleles listed on the IMGT/HLA web page 2016-July-14, release 3.25.0, www.ebi.ac.uk/imgt/hla.

³Alleles that have been deleted from or renamed in the official WHO HLA Nomenclature up to and including the last IMGT/HLA database release can be retrieved from web page http://hla.alleles.org/alleles/deleted.html.

PROTOCOL

Lot-specific information

DNA EXTRACTION

Extracted, highly pure DNA is needed for SSP typings. DNA samples to be used for PCR-SSP HLA typing should be re-suspended in dH $_2$ O. The A260/A280 ratio should be 1.6 – 2.0 by UV spectrophotometry for optimal band visualization during electrophoresis.

We recommend automated DNA extraction with the QIAGEN EZ1 DSP DNA Blood System. ACD blood should be used as starting material.

Alternatively, the DNA can be extracted by any preferred method yielding pure DNA. When using alternative methods, the DNA concentration should be adjusted to 30 ng/µl. **Do not use heparinised blood with these methods.**

Recommended DNA concentration using:

EZ1-extracted DNA, 15 ng/μl.

DNA extracted by other methods, 30 ng/µl.

Concentrations exceeding 50 ng/ μ l will increase the risk for nonspecific amplifications and weak extra bands, especially for HLA Class I high resolution SSP typings. If necessary, dilute the extracted DNA in dH₂O.

DNA samples should not be re-suspended in solutions containing chelating agents such as EDTA, above 0.5 mM in concentration.

DNA samples may be used immediately after extraction or stored at +4°C for up to 2 weeks with no adverse effects on results. DNA samples can be stored at -20°C or colder for 9 months. The purity and concentration of extracted DNA samples that have been stored for a prolonged period should be tested for acceptability prior to HLA typing.

DNA samples should be shipped at +4°C or colder to preserve their integrity during transport.

PCR AMPLIFICATION

104.201-12 – including *Taq* polymerase

For one KIR HLA Ligand typing, begin by adding to well 7, i.e. the well with the negative control primer pairs:

 $7 \mu l dH_2O$

3 µl PCR Master Mix complete with Tag,

then add at room temperature in a 0.5 ml tube:

 $8 \times 2 \mu I = 16 \mu I DNA (30 ng/\mu I)$

8 x 3 μ l = 24 μ l PCR Master Mix with Taq – mix well before taking your aliquot

 $8 \times 5 \mu l = 40 \mu l dH_2O$

104.201-12 – including *Taq* polymerase 104.201-12u – without *Taq* polymerase

General "Instructions for Use" IFU-03 can be downloaded from

Lot No.: 4E6 Lot-specific information www.olerup-ssp.com

Mix well, dispense 10 µl of the DNA-PCR Master Mix-H₂O mixture into each of the 6 wells of a KIR HLA Ligand typing, i.e. wells 1 to 6. Cover the primer tray(s) with the provided adhesive seals. Check that all reaction wells are completely covered to prevent evaporative loss during PCR amplification.

104.201-12u – without *Taq* polymerase

For one KIR HLA Ligand typing, begin by adding at room temperature in a 0.5 ml tube:

9 x 3 μ l = 27 μ l PCR Master Mix without Taq – mix well before taking your aliquot

0,8 μl *Taq* polymerase (5 units/μl)

Mix well, dispense 3 μ l of the PCR Master Mix-Taq mixture from the 0.5 ml tube into well No. 7, i.e. the well with the negative control primer pairs. Then add 7 μ l dH₂O to well 7.

Then add at room temperature to the 0.5 ml tube containing 27 + 0.8 - 3 = 24.8 μ l PCR Master Mix-Tag mixture:

$$8 \times 2 \mu l = 16 \mu l DNA (30 ng/\mu l)$$

$$8 \times 5 \mu I - 0.8 \mu I = 39.2 \mu I dH2O$$

Mix well, dispense 10 μ l of the DNA-PCR Master Mix-Taq-H₂O mixture into each of the 6 wells of a KIR HLA Ligand typing, i.e. wells 1 to 6. Cover the primer tray(s) with the provided adhesive seals. Check that all reaction wells are completely covered to prevent evaporative loss during PCR amplification.

Use a 96 well thermal cycler with a heated lid. The temperature gradient across the heating block should be < 1°C.

PCR cycling parameters:

1. 1 cycle	94°C	2 min	denaturation
2. 10 cycles	94°C 65°C	10 sec. 60 sec.	denaturation annealing and extension
3. 20 cycles	94°C 61°C 72°C	10 sec. 50 sec. 30 sec.	denaturation annealing extension
4. End - hold	RT 4°C		if less than 8 hours if longer than 8 hours

Total reaction volume in each well, 10 µl.

The same PCR cycling parameters are used for all the Olerup SSP® kits.

AGAROSE GEL ELECTROPHORESIS

Prepare a 2% (w/v) agarose gel in 0.5 x TBE buffer. Dissolve the agarose by boiling in a microwave oven. Let the gel solution cool to 60°C. Stain the gel prior

KIR HLA Ligand Product Insert Page 7 of 16
104.201-12 – including *Taq* polymerase General "Instructions for Use"
104.201-12u – without *Taq* polymerase IFU-03 can be downloaded from

Lot No.: **4E6** Lot-specific information www.olerup-ssp.com

to casting with ethidium bromide (10 mg/ml), 5 μ l per 100 ml gel solution. For maximal ease of handling use our ethidium bromide dropper bottle (Product No. 103.301-10), 1 drop of ethidium bromide solution per 50-75 ml of gel, or our GelRedTM dropper bottle (Product No. 103.302-05) 4 drops per 100-120 ml of gel solution. Note: Ethidium bromide is a powerful carcinogen. Handle with appropriate personal protective equipment.

Load the PCR products, preferably using an 8-channel pipette. Load a DNA size marker (100 base pair ladder, Product No. 103.202-100 or DNA Size Marker for short gel runs 103.203-100) in one well per row.

Run the gel in 0.5 x TBE buffer, without re-circulation of the buffer, for 15-20 minutes at 8-10 V/cm.

DOCUMENTATION AND INTERPRETATION

Put the gel on a UV transilluminator and document by photography.

Record the presence and absence of specific PCR products. The relative lengths of the specific PCR products are helpful in the interpretation of the results.

Record the presence and relative lengths of the internal positive control bands. The differently sized control bands will help in the correct orientation of the typing as well as in kit identification.

Lanes without either control band or specific PCR products should be repeated.

Interpret the typings with the *lot-specific Interpretation and Specificity Tables*.

PCR MASTER MIXES

October 2016

Rev. No.: 00

The PCR Master Mix complete with *Taq* polymerase contains:

Tag polymerase 0.4 unit per 10 μl SSP reaction

 $\begin{array}{ll} \text{nucleotides} & \text{final concentration of each dNTP is 200 } \mu\text{M} \\ \text{PCR buffer} & \text{final concentrations: 50 mM KCI, 1.5 mM MgCl}_2, \\ \end{array}$

10 mM Tris-HCl pH 8.3, 0.001% w/v gelatin

glycerol final concentration of glycerol is 5%

cresol red final concentration of cresol red is 100 µg/ml

The same PCR Master Mix complete with Tag is used for all Olerup SSP® kits.

The PCR Master Mix without *Taq* polymerase contains:

nucleotides final concentration of each dNTP is 200 μ M PCR buffer final concentrations: 50 mM KCl, 1.5 mM MgCl₂,

10 mM Tris-HCl pH 8.3, 0.001% w/v gelatin

glycerol final concentration of glycerol is 5%

cresol red final concentration of cresol red is 100 µg/ml

The same PCR Master Mix without Taq is used for all Olerup SSP® kits.

7 9	-	-	Negative Control	

¹Alleles are assigned by the presence of specific PCR product(s). However, the sizes of the specific PCR products may be helpful in the interpretation of KIR HLA Ligand SSP typings.

When the primers in a primer mix can give rise to HLA-specific PCR products of more than one length this is indicated if the size difference is more than 20 base pairs. Size differences of 20 base pairs or less are not given. For high resolution SSP kits, the alleles listed are specified according to amplicon length.

Nonspecific amplifications, i.e. a ladder or a smear of bands, may sometimes be seen. GC-rich primers have a higher tendency of giving rise to nonspecific amplifications than other primers.

PCR fragments longer than the control bands may sometimes be observed. Such bands should be disregarded and do not influence the interpretation of the SSP typings.

PCR fragments migrating faster than the control bands, but slower than a 400 bp fragment may be seen in some gel read-outs. Such bands can be disregarded and do not influence the interpretation of the SSP typings. Some primers may give rise to primer oligomer artifacts. Sometimes this phenomenon is an inherit feature of the primer pair(s) of a primer mix. More often it is due to other factors such as too low amount of DNA in the PCR reactions, taking too long time in setting up the PCR reactions, working at elevated room temperature or using thermal cyclers that are not pre-heated.

²The internal positive control primer pairs amplify segments of the human growth hormone gene. The internal positive control bands are 1070 or 800 base pairs respectively, well distribution as outlined in the table. Well number 1 contains the shorter, 800 bp, internal positive control band. The well distribution of the internal controls can help in orientation of the kit on gel photo, as well as allow for kit identification. In the presence of a specific amplification the intensity of the control band often decreases.

³For several HLA Class I alleles 1st and/or 4th exon(s) and beyond, as well as intron nucleotide sequences, are not available. In these instances it is not known whether some of the primers of the SSP sets are completely matched with the target sequences or not. Assumption is made that unknown sequences in these regions are conserved within allelic groups.

⁴Primer mixes 3 and 4 may have tendencies of unspecific amplifications.

⁵The primer pairs in primer mix 1 will not amplify the C*01:46^{Asn80}, C*07:78:02 ^{Asn80}, C*07:426 ^{Asn80}, C*07:459 ^{Asn80}, C*07:478 ^{Asn80} and C*16:94 ^{Asn80} alleles.

 6 The primer pairs in primer mix 2 will also amplify the C*05:32 Arg80 , C*06:160 Gln80 , C*15:60 Gln80 and C*15:71 Ile80 alleles

⁷The primer pairs in primer mix 3 will not amplify the B*44:05:03 Thr80, B*44:152Thr80, B*44:196 Thr80 alleles.

 8 The primer pairs in primer mix 6 will not amplify the B*27:49 Thr80 , B*27:142 Thr80 , B*37:10 Thr80 and B*47:04 Thr80 alleles.

⁹Primer mix 7 contains a negative control, which will amplify more than 95% of HLA amplicons as well as the amplicons generated by the control primer pairs matching the human growth hormone gene. HLA-specific PCR product sizes range from 75 to 200 base pairs and the PCR product generated by the HGH positive control primer pair is 430 base pairs.

'Asn', asparagine; 'Asp', aspartic acid; 'lle', isoleucine; 'Lys', lysine; 'Thr', threonine

¹The provided cell line HLA specificities are retrieved from the http://www.ihwg.org/hla web site. The specificity of an individual cell line may thus be subject to change.

²The specificity of each primer solution in the kit has been tested against 48 well characterized cell line DNAs and where applicable, additional cell line DNAs.

Additional primer in primer solution 6 was tested by separately adding another 5'-primer. In primer solutions 1 to 4 one, two or three of the 3'-primers were not possible to test.

TRADEMARKS USED IN THIS DOCUMENT/PRODUCT

Olerup SSP[®] is a registered trademark of Olerup SSP AB. Qiagen™ is a trademark of QIAGEN.

WARRANTY

Olerup SSP AB warrants its products to the original purchaser against defects in materials and workmanship under normal use and application. Olerup SSP AB's sole obligation under this warranty shall be to replace, at no charge, any product that does not meet the performance standards stated on the product specification sheet.

This warranty applies only to products that have been handled and stored in accordance with Olerup SSP AB's recommendations, and does not apply to products that have been the subject of alternation, misuse, or abuse.

All claims under this warranty must be directed to Olerup SSP AB in writing and must be accompanied by a copy of the purchaser's invoice. This warranty is in lieu of all other warranties, expressed or implied, including the warranties of merchantability and fitness for a particular purpose. In no case shall Olerup SSP AB be liable for incidental or consequential damages.

This product may not be reformulated, repacked or resold in any form without the written consent of Olerup SSP AB, Franzengatan 5, SE-112 51 Stockholm, Sweden.

Handle all samples as if capable of transmitting disease. All work should be performed wearing gloves and appropriate protection.

GUARANTEE

October 2016

Rev. No.: 00

Olerup SSP AB guarantees that the primers in the Olerup SSP® typing trays have the specificities given in the lot-specific Specificity and Interpretation Tables of the product insert.

When stored at -20°C, the dried primers are stable for 30 months from the date of manufacture.

When stored at -20°C, the PCR Master Mix including *Taq* polymerase and the PCR Master Mix without *Tag* polymerase are stable for 33 months from the date of manufacture.
